Introduction

- Missing data is a frequent issue in SAR-derived products in both space and time dimensions
- Causes : rapid surface changes, missing image, possible limitations of displacement extraction techniques.

Argentiere glacier, offset tracking of TerraSAR-X in Summer 2010 (Fallourd et al. 2011)

Interferogram over land area, Mexico (Isterre)

Motivation of the study

How can we manage the presence of **spatio-temporal** missing data in time series?

Develop a gap-filling method capable of handling :

- 1. Random gaps, correlated gaps in space and time
- 2. Displacement signal complexity : mixed low and high frequency patterns
- 3. Different noise behavior : random, correlated in space and time

| Introduction | The EM-EOF method •00000 | Numerical simulations | Application to alpine glaciers | Conclusion and perspectives | Références |

| | | | | | |
| The EN | I-FOF metho | nd | | | |

- Based on empirical orthogonal functions (EOFs) : the data can be expressed in terms of EOF modes which describe a temporal or spatial variability
- Data can be interpolated by first initializing the missing values
- The EM principle is used : (1) first estimation of the data gaps with their expected value (Expectation step) and (2) minimization of the reconstruction error between reconstructed and initial data until convergence (Maximization step).

| | | | | | |
| The EN | I∕-EOF metho | od : data | | | |

Let *X*(**s**, *t*) be a spatio-temporal field containing the values of *X* at position **s** and time *t*:

$$X = (\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_n) = \begin{pmatrix} x_{11} & x_{12} & x_{13} & \cdots & x_{1n} \\ x_{21} & x_{22} & x_{23} & \cdots & x_{2n} \\ x_{31} & x_{32} & x_{33} & \cdots & x_{3n} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ x_{p1} & x_{p2} & x_{p3} & \cdots & x_{pn} \end{pmatrix}$$

 $(x_{ij})_{1 \le i \le p, 1 \le j \le n}$ is the value at position \mathbf{s}_i and time t_j and may be missing.

Missing values are then initialized by an appropriate value (first guess).

|--------------|-------------------|-----------------------|--------------------------------|-----------------------------|------------|
| | | | | | |
| The EM | 1-EOF metho | d | | | |

The sample temporal covariance is first estimated :

$$\hat{C} = \frac{1}{p-1} (X - \mathbf{1}_{\mathbf{n}} \bar{X})^T (X - \mathbf{1}_{\mathbf{n}} \bar{X})$$

| Introduction | The EM-EOF method 00●000 | Numerical simulations | Application to alpine glaciers | Conclusion and perspectives | Références |
|--------------|-----------------------------|-----------------------|--------------------------------|-----------------------------|------------|
| | | | | | |
| The EN | /I-EOF metho | od | | | |

The sample temporal covariance is first estimated :

$$\hat{C} = \frac{1}{p-1} (X - \mathbf{1}_{\mathbf{n}} \bar{X})^T (X - \mathbf{1}_{\mathbf{n}} \bar{X})$$

EOFs $(\mathbf{u}_i)_{0 \le i \le n}$ are the solution of the eigenvalue problem :

 $\hat{C}U = \Lambda U$

| Introduction | The EM-EOF method | Numerical simulations | Application to alpine glaciers | Conclusion and perspectives | Références |
|--------------|-------------------|-----------------------|--------------------------------|-----------------------------|------------|
| | | | | | |
| The EN | A-EOF metho | bd | | | |

The sample temporal covariance is first estimated :

$$\hat{C} = \frac{1}{p-1} (X - \mathbf{1}_{\mathbf{n}} \bar{X})^T (X - \mathbf{1}_{\mathbf{n}} \bar{X})$$

EOFs $(\mathbf{u}_i)_{0 \le i \le n}$ are the solution of the eigenvalue problem :

 $\hat{C}U = \Lambda U$

EOFs can be used to express \hat{C} in terms of EOF modes :

$$\hat{C} = \lambda_1 \mathbf{u}_1 \mathbf{u}_1^T + \lambda_2 \mathbf{u}_2 \mathbf{u}_2^T + \dots + \lambda_n \mathbf{u}_n \mathbf{u}_n^T$$

| Introduction | The EM-EOF method 000●00 | Numerical simulations | Application to alpine glaciers | Conclusion and perspectives | Références |
|--------------|-----------------------------|-----------------------|--------------------------------|-----------------------------|------------|
| | | | | | |
| The FI | I-FOF metho | bd | | | |

■ X is reconstructed with M number of EOFs :

$$X' = \sum_{i=1}^n a_i \mathbf{u}_i^t o \hat{X} = \sum_{i=1}^{M \ll n} a_i \mathbf{u}_i^t$$

with $a_i = X' \mathbf{u}_i$ are the Principal Components (PCs) of the anomaly field (X').

The first EOF modes capture the main temporal dynamical behavior of the signal whereas other modes represent various perturbations (Prébet et al. 2019).

| Introduction | The EM-EOF method 0000●0 | Numerical simulations | Application to alpine glaciers | Conclusion and perspectives | Références |
|--------------|-----------------------------|-----------------------|--------------------------------|-----------------------------|------------|
| | | | | | |
| Cross- | validation | | | | |

The reconstruction error is computed using a cross-validation root-mean-square error (cross-RMSE) :

$$E(k) = \left[\frac{1}{N}\sum_{k=1}^{N}|\hat{\mathcal{X}}_k - \mathcal{X}|^2\right]^{1/2}$$

The optimal number of EOF modes *M* minimizes E(k) : $\arg \min_{M \in [1,n]} E(k)$

|--------------|-------------------|-----------------------|--------------------------------|-----------------------------|------------|
| | | | | | |

Error maps

- The method is more sensitive to SNR than the % of gaps
- Random gaps affect more the reconstruction than correlated gaps
- Initialization value affects the time of convergence but not the estimation of M

|--------------|-------------------|-----------------------|--------------------------------|-----------------------------|------------|
| | | | | | |

Gorner Glacier

incomplete SAR displacement time series, 2019, submitted.

- Number of EOF modes : 3
- Consistent pattern in missing data areas
- Missing interferogram is reconstructed by adding the temporal mean to the anomaly

| Introduction 00 | The EM-EOF method | Numerical simulations | Application to alpine glaciers | Conclusion and perspectives | Références |
|--------------------|-------------------|-----------------------|--------------------------------|-----------------------------|------------|
| | | | | | |

Miage Glacier

- Number of EOF modes : 2
- Discontinuities in the residuals due to phase jumps in the original interferogram
- Detection and correction of inconsistencies

| | | | | | |
| | | | | | |

Argentière Glacier

- Very low SNR and strong correlated gaps in space and time
- Strong mixing between displacement signal and noise
- Global agreement between reconstructed and initial fields

| Introduction | The EM-EOF method | Numerical simulations | Application to alpine glaciers | Conclusion and perspectives ●O | Références |
|--------------|-------------------|-----------------------|--------------------------------|-----------------------------------|------------|
| | | | | | |
| - · | | | | | |

Conclusion

- EM-EOF is more sensitive to noise than gaps
- In the case of spatio-temporally correlated noise, the optimal number of EOF modes can be over-estimated
- Handling of complex cases :
 - missing interferograms
 - discontinuities due to phase jumps (due to coherence loss)
- Argentière case : limiting condition because of strong mixing between noise and displacement signal
- The method can help in increasing the effective size of a time series
